

Personas

Damla is a 22 year old senior Law student living in Izmir. She is the daughter of a retired banker and an administrative worker, and she is known for being very disciplined. Because her home is far from the campus, time management is important for her, and she plans her day minute by minute. During her graduation exam period, the library is her only place to study. However, if she goes there and cannot find a seat, she wastes 2 hours on the road. She uses LibTracker to check real time occupancy before leaving home to make a smart decision and use her time well.

Bariş is a 23 year old Computer Engineering student living in Istanbul. As the son of an engineer and a librarian, he cares a lot about accurate data and sharing information with others. He spends most of his day doing deep research in libraries and is very careful in his academic life. During exam seasons, crowds and noise are a big problem for his focus. He uses LibTracker not just to find a seat, but to help the system stay accurate. By sharing the current occupancy and silence levels, he aims to help other students get the right information.

Scenario

Damla is looking for a place to study during midterm week. She has a very important exam the next day and needs to focus in the library. She is worried about not finding a seat because the campus is crowded and study areas are limited. In the past, she lost a lot of time going to the library and finding it full, which hurt her exam success. To save time, she opens the LibTracker app before leaving home. She checks the real time feedback entered by Barış, who is currently at the library. She sees that the main library is full, but there is space in the faculty reading room. Damla goes straight to the faculty room, finds a desk quickly, and starts studying.

USER STORIES

*As a student, I want to see the library's live occupancy so I can decide whether to go or not.

*As a student during exams, I want to find less crowded areas so I don't waste time looking for a seat.

*As a student in the library, I want to share the current occupancy status so others can see real time data.

*As a developer, I want to build a system that prevents fake feedback so the app's data stays correct and reliable.

*As a university student, I want to see hourly and daily statistics so I can plan my study time for when the library is quiet.

*As library management, I want to analyze how students use the library to manage resources better.

*As university management, I want to see occupancy statistics to make plans that help students be more productive.

*As university management, I want to use these statistics to open new study areas when it gets too crowded.

FEATURES

*Sending user feedback

*Displaying current occupancy status

*Showing hourly and daily statistics
